CAREER OBJECTIVE

Generative AI Engineer who has shipped a production multi-agent research system (RAG, hallucination detection via an independent fact-checking agent, and an LLM-judge evaluation pipeline) using LangChain and Gemini. Looking to bring that same rigor — measuring and verifying AI outputs, not just generating them — to a team building real GenAI products.

EDUCATION

Bachelor of Science in Information Technology (BS IT)

2022 – 2026

University of Education Lahore, Pakistan

TECHNICAL SKILLS

Generative AI & LLM Development

LangChain, Google Gemini API, Multi-Agent Systems, Prompt Engineering, RAG

Programming Languages

Python

Web & App Frameworks

Flask, Streamlit

Machine Learning & Computer Vision

Deep Learning, Image Classification, TensorFlow/Keras, OpenCV

Tools & Platforms

Git/GitHub

PROJECTS

AI Research & Report Team — Multi-Agent System

Personal Project | LangChain, Google Gemini, RAG, Streamlit

- Engineered a 6-agent pipeline (Planner, Researcher, Fact Checker, Writer, Editor, Evaluation Judge) producing cited, hallucination-checked reports from web search and uploaded documents
- Implemented RAG with Gemini embeddings and a custom vector store, using structured Pydantic outputs throughout in place of free-text LLM responses
- Built an Evaluation Dashboard scoring relevance, faithfulness, and citation accuracy via an independent LLM judge; deployed live on Streamlit Community Cloud
- Live Demo: multi-agent-report-team-fb2shsrakct74rrdxt46f.streamlit.app | GitHub: github.com/im-nazim/multi-agent-report-team

Iris Flower Species Classifier

Personal Project | Python, scikit-learn, Streamlit

- Built a supervised learning pipeline classifying Iris flowers into 3 species using a Decision Tree Classifier, achieving high accuracy on held-out test data
- Designed a modular pipeline (data loading, splitting, training, evaluation) and an interactive Streamlit app for live predictions
- GitHub: github.com/im-nazim/iris-flower-classifier

FINAL YEAR PROJECT

Retinal Disease Detection using Deep Learning

2025 – 2026

University of Education Lahore | Deep Learning / Computer Vision

- Developed a deep learning model to classify retinal diseases from fundus images with high accuracy
- Implemented ECSA-Net architecture to extract and analyze features from retinal image datasets
- System outputs disease probability scores to assist in early clinical detection and diagnosis
- Technologies used: Python, TensorFlow/Keras, OpenCV, ECSA-Net

CERTIFICATIONS

Artificial Intelligence (AI) — Virtual Internship

DecodeLabs

Global Internship Credential — July 2026 – August 2026
