CAREER OBJECTIVE

Recent BS IT graduate with hands-on Python experience, seeking the Python (Django/FastAPI) internship track. I have built and deployed a multi-agent application in Python with structured, validated data models and third-party API integration, and I work daily with Git/GitHub. I write clearly, explain my technical decisions comfortably, and learn new frameworks quickly.

EDUCATION

Bachelor of Science in Information Technology (BS IT) | 2022 – 2026
University of Education, Lahore, Pakistan

TECHNICAL SKILLS

Programming: Python 3 (modular design)

Web & Backend: Flask, Streamlit, REST API integration, SQLite (sqlite3), Pydantic data validation (the model layer FastAPI is built on)

Tools & Workflow: Git, GitHub (repositories, version control, deployment via Streamlit Community Cloud), pytest, command line

AI / ML: LangChain, Google Gemini API, RAG, Prompt Engineering, TensorFlow/Keras, OpenCV, pandas

PROJECTS

AI Research & Report Team — Multi-Agent System

Personal Project | Python, LangChain, Google Gemini, Pydantic, Streamlit

- Designed and built a 6-component Python application (Planner, Researcher, Fact Checker, Writer, Editor, Evaluation Judge), each with a single, clear responsibility.
- Used structured Pydantic models for all inputs and outputs instead of free text, making data flow between components predictable and easier to debug.
- Integrated external APIs (Gemini, web search) and implemented a retrieval pipeline with embeddings and a custom vector store.
- Built an evaluation dashboard measuring relevance, faithfulness, and citation accuracy; deployed live on Streamlit Community Cloud.
- Live Demo: multi-agent-report-team-fb2shsrakct74rrdxte46f.streamlit.app | GitHub: github.com/im-nazim/multiagent-report-team

AI Content Generator — Full-Stack Streamlit App

Personal Project | Python, Streamlit, Gemini API (google-genai), SQLite, pandas, pytest

- Built a multi-tab app that turns one content brief into five platform-specific outputs (Facebook, LinkedIn, Instagram, hashtags, ad), parsing the model response into structured sections for separate display, copy and download.
- Designed a SQLite data layer (*storage.py*) for generation history, brand voice settings and a content calendar, supporting create, browse, delete and schedule-by-date operations; built an analytics dashboard from that data with pandas.
- Wrote 15 pytest unit tests for the storage layer (history, calendar, brand voice, analytics), using isolated temporary databases so real data is never touched.
- Kept the API key out of git (Streamlit secrets / environment variables), added automatic fallback to a second model, and specific error messages for invalid keys, rate limits and timeouts.
- GitHub: github.com/im-nazim/ai-content-generator

FINAL YEAR PROJECT

Retinal Disease Detection using Deep Learning | 2025 – 2026

University of Education, Lahore | Python, TensorFlow/Keras, OpenCV

- Developed a deep learning model to classify retinal diseases from fundus images using the ECSA-Net architecture.
- Built the full workflow from image preprocessing to training and evaluation; the system outputs disease probability scores.

CERTIFICATIONS

Artificial Intelligence (AI) — Virtual Internship, DecodeLabs (July 2026 – August 2026)
